Risk-guided Disease management plan to prevent CAD in patients treated with previous chemotherapy

(REDEEM-CAD)

The Menzies Institute for Medical Research is conducting a study on detection and management of cardiac complications of cancer treatment.

If you have had **chemotherapy for cancer**, there is a possibility that you may have had some damage to your heart.

You may qualify for an important study of cardiac scans and exercise testing to see if any damage has occurred. If there is evidence of heart damage, you may receive exercise training and medications that could help the heart recover.

To be eligible to participate, you must be:

1. Aged 40-70 years
2. History of cancer more than 5 years ago
3. Not taking a cholesterol lowering tablet

For further information about this study, please email the Menzies Institute at redem.menzies@utas.edu.au or phone Kerrie Larsen, Research Assistant on **03 6226 4648**.
